

Effective from: 28th September 2025

Below is an explanation of your heating & hot water tariff calculations. These solely cover operational costs, and your heat supplier makes no profit from this.

Your unit rate breakdown 12.69 p/kWh

A pie chart illustrating the breakdown of the total heat network service charge. The chart is divided into six segments, each representing a different cost component. The segments are color-coded and labeled with their respective values in pence (p). The largest segment is orange, representing 'Insite metering & billing charge' at 32.44p. The next largest is purple, representing 'ESCO Manager service charge' at 22.03p. Other segments include 'PAYG SaaS fee' (light blue, 14.64p), 'Other heat network service costs' (dark blue, 9.55p), and 'Incoming supply standing charge' (green, 5.04p).

Category	Value (pence)
Insite metering & billing charge	32.44p
ESCO Manager service charge	22.03p
PAYG SaaS fee	14.64p
Other heat network service costs	9.55p
Incoming supply standing charge	5.04p

⚠ Please note, your heat supplier does not profit from the operation of your heat network

Your **unit rate** covers the cost of the energy generated in the communal plant room. It also includes any associated heat losses between the plant room and your home. Your energy consumption is measured via the heat meter installed in your home, so you only pay for what you have used. You are charged for every kilowatt-hour (kWh) consumed within your property.

Your **daily standing charge** is the fixed charge passed on by your heat supplier, which covers the cost of operating the heat network and delivering energy to your home. This is an annual fixed amount that is payable every day by all residents regardless of how much energy they use.

Depending on your heat supplier, the costs associated with running and maintaining the heat network will either be included within your building service charge or your heating & hot water daily standing charge.

Glossary

To help you understand the different elements that go into your tariff, we've put the below glossary together for you.

Unit rate glossary

Incoming fuel supply cost - The cost per kilowatt-hour (kWh) of fuel consumed by the boilers in the plant room. This generates the energy used for heating & hot water in your home.

Distribution heat loss cost - The cost of any heat lost through the pipework across the heat network. Heat loss during energy distribution is unavoidable and increases the cost of heat produced in the plant room. We calculate heat losses across the network by comparing the heat energy leaving the plant room to the heat consumed within the network's properties. If this data is unavailable, a standard efficiency calculation of 60% is used.

Plant room efficiency cost - The cost of converting the incoming fuel supply (e.g. gas) into heat energy. The conversion process, burning fuel to produce heat, cannot be 100% efficient. The efficiency of this process inflates the cost of incoming fuel to the cost of heat produced.

Daily standing charge glossary

Incoming supply standing charge - The daily standing charge your heat supplier pays on the incoming fuel supply contract to cover the fixed costs of delivering gas or electricity into the plant room. This is then used to generate the heat energy for your home and is charged regardless of how much energy is used.

Insite metering & billing charge - This may cover: our metering & billing fees, the cost of reading all landlord meters around the network allowing us to monitor system efficiency and heat losses, costs associated with remotely collecting your meter reads, and transaction fees charged by the payment platform for every payment made.

PAYG SaaS fee - The cost of third-party 'software as a service' (SaaS) fees for operating the pay-as-you-go (PAYG) or metering system installed.

ESCo Manager service charge - The cost of Insite providing ESCo Manager services to your heat network. This includes: the procurement, and management of mechanical, energy and service provider contracts (ensuring that contractual quality and cost related KPI's are adhered to), and financial management of the energy account (ensuring we only recover the costs to operate and serve the heat network).

Other heat network service costs - These may include: costs to perform tariff reviews, tariff communication costs, monitoring and reporting fees (a licence fee incurred to monitor and present a range of data across the network to support financial and operational management) and compliance
